Case Study Title: Cost Savings with Subsurface Utility Engineering for a Bridge Replacement Project in Blair County, Pennsylvania#1

Utility Name: PennDOT

Case Study Abstract: SUE is an engineering process used to identify and map underground utilities and structures as well as assign a quality level to data. There are different geophysical techniques available to acquire data regarding the two-dimensional location of underground utilities. It is important for designers or engineers to be familiar with various geophysical methods for successful designations of underground utilities. GPR and EM technologies are two predominant technologies that are used in designating and locating the underground utilities. This case study investigated the cost savings incurred by application Subsurface Utility engineering principles for a bridge replacement project in Blair County, Pennsylvania.
